

# Lecture 1: Welcome & Big-O

January 11, 2022

*Lecturer: Frederic Faulkner**Scribe: Aditya Diwakar*

Welcome to CS3510! Lecture began by reviewing the syllabus, please read this syllabus and become familiar with the class structure.

## 1 Big O

Why do we care about Big O? It's hard to talk about performance because runtime (by seconds) varies by computer by computer. Time based performance is affected by a variety of things: code efficiency, hardware, background tasks, etc. We only care about one item: *code efficiency*.

We want to ignore multiplicative (hardware performance) and additive (i.e. loading time) constants. Hence, we introduce Big-O. We say the following:

$f(n)$  is  $O(g(n))$  if  $\exists c, k : f(n) \leq c \cdot g(n)$  when  $n > k$  (for large enough inputs).

Another way to say this is that if  $f(n) = O(g(n))$ , then we can say that the growth of  $f(n)$  is bounded above by  $g(n)$ .

The "O" can be thought of equivalently as  $\leq$ . When we say  $f(n)$  is  $O(g(n))$ , this is somewhat related to  $f(n) \leq g(n)$ . We are comparing the rates of growth (rather than the functions directly). We also have:

$\Omega$ :  $f(n)$  is  $\Omega(g(n))$  if  $g(n)$  is  $O(f(n))$  (reverse)

$\Theta$ :  $f(n)$  is  $\Theta(g(n))$  if  $f(n)$  is  $O(g(n))$  AND  $g(n)$  is  $O(f(n))$  (both ways)

## 1.1 Examples

1.  $n$  is  $O(n^2)$  ( $n^2$  grows faster than  $n$ )
2.  $n^2$  is  $\Omega(n)$  ( $n$  grows slower than  $n^2$ )
3.  $n$  is  $\Theta(3n + 27001)$  (ignoring constants, these grow at the same rate)

Proving (3) using the definition from above:

$$\frac{n}{3n + 27001} < 1 \quad n \geq 0 \quad (1)$$

and the reverse direction...

$$\frac{3n + 27001}{n} = \frac{3n}{n} + \frac{27001}{n} = 3 + \underbrace{\frac{27001}{n}}_{\leq 27001 \text{ when } n \geq 1} \leq 3 + 27001 = 27004 \quad (2)$$

Hence, using equation (1), we have shown that  $n$  is  $O(3n + 27001)$  using (2),  $3n + 27001$  is  $O(n)$ , hence  $n$  is  $\Theta(3n + 27001)$ .  $\square$

## 1.2 Important Notes of Big O

1. Ignore multiplicative constants
2.  $n^a$  dominates  $n^b$  if  $a > b$ :  $n^2$  is  $O(n^4)$  and  $n^4$  is NOT  $O(n^2)$  so we can focus on what contributes to growth the most, simplifying polynomials.
3. Exponentials dominate any polynomial, for example:

$$2^{0.5n} \text{ is } \Omega(n^{16,000} + n^{10,000,000})$$
$$a^n \text{ is dominated by } b^n \text{ for } a < b$$

4. Any polynomial dominates any log

For practice, let us compare  $2^n$  vs  $2^{n+1}$  by using a ratio method:

$$\frac{2^n}{2^{n+1}} = \frac{1}{2} \quad \text{and} \quad \frac{2^{n+1}}{2^n} = 2$$

hence  $2^n$  is  $O(2^{n+1})$  and  $2^{n+1}$  is  $O(2^n)$  meaning  $2^{n+1}$  is  $\Theta(2^n)$ .

## 1.3 More Examples

1. What is the relationship between  $n$  and  $3^{\log_5 n}$ ?

Using logarithm rules, notice that  $3 = 5^{\log_5 3}$  so we can rewrite  $3^{\log_5 n}$ :

$$3^{\log_5 n} = (5^{\log_5 3})^{\log_5 n} = 5^{(\log_5 3 \cdot \log_5 n)} = \left(5^{(\log_5 n)}\right)^{\log_5 3} = \boxed{n^{\log_5 3}}$$

and since  $3 < 5$ , then  $\log_5 3 < 1$ , meaning  $n$  dominates  $3^{\log_5 n}$ .

2. What is the relationship between  $\sqrt{n}$  and  $\log^2 n$ ?

Recall that  $\sqrt{n} = n^{0.5}$  meaning  $n^{0.5}$  is polynomial and using rule (4), we know that this dominates any logarithm hence  $\log^2 n$  is  $O(\sqrt{n})$

3. What is the relationship between  $2^n$  and  $2^{n/2}$ ?

$$2^{n/2} = 2^{0.5n} = (2^{0.5})^n = (\sqrt{2})^n$$

This means that  $2^{n/2}$  has a smaller base, and therefore is  $O(2^n)$ .
